Aspirin

A low dose of Aspirin (81mg) every day can protect your heart, but it's not the best medicine to take for pain, swelling, or fever.

OTC

How It Works

Relieves pain, fever, and inflammation. Protects your heart and thins blood.

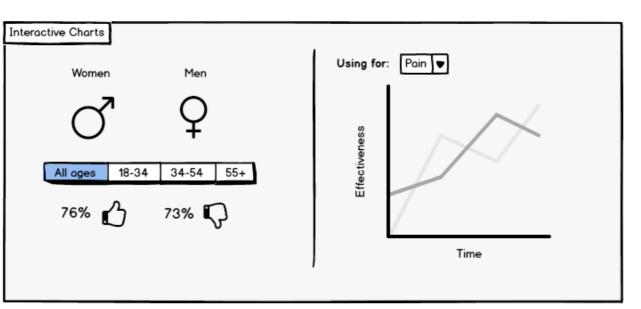

Aspirin is a salicylate and non-steroidal antiinflammatory drug (NSAID). It blocks the inflammation process in your body, which relieves swelling and pain. It also prevents blood platelets from forming clots, which thins your blood.

Aspirin raises your risk of bleeding, especially when used with other blood thinner medications like warfarin (Coumadin).

Studies show that using higher doses of Aspirin (162. mg or more) every day raises your risk of stomach

bleeding and doesn't provide any additional heart
