Wikipedia

Ibuprofen is a nonsteroidal anti-inflammatory drug (NSAID). It works by reducing hormones that cause inflammation and pain in the body.

Ibuprofen is used to reduce fever and treat pain or inflammation caused by many conditions such as headache, toothache, back pain, arthritis, menstrual cramps, or minor injury.

Ibuprofen is used in adults and children who are at least 6 months old.

Ibuprofen may increase your risk of fatal heart attack or stroke, especially if you use it long term or have heart disease. Do not use this medicine just before or after heart bypass surgery (coronary artery bypass graft, or CABG).

Ibuprofen may also cause stomach or intestinal bleeding, which can be fatal. These conditions can occur without warning while you are using this medicine.

Do not take more than your recommended dose. An ibuprofen overdose can damage your stomach or intestines. Use
